Tightly associated subunits (TAF's) are components of the transcription factor TFIID and are thought to mediate transcriptional activation. This encoded protein may be produced recombinantly from transformed host cells or purified from human cells. hTAFII105 specific binding agents such as specific antibodies could be used for diagnosis (e.g. genetic hybridisation screens for hTAFII105 transcripts), therapy (e.g. gene therapy to modulate hTAFII105 gene expression) and in the biopharmaceutical industry (e.g. as immunogens, reagents for isolating B

CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or cc quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in acidernosic format directly from WIPO at the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 20; SEQ ID No 39827; 103pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N-PSDB;

                                                                                                                                                                    wt. of 130 kD by SDS-PAGE.

The invention relates to purified proteins involved in transcription by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction of IIID has been shown to contains a TBP and other TAPS Purification of TPIID and separation of its components reveals 7 proteins ranging in size from 30-250 kD. serum raised against the TFIID fraction allowed cloning of the corresp.
                                                                                                                                                                                                                                                                                             This is the amino acid sequence of the human TATA-binding protein (TBP) associated factor (TAF) designated TAFILI30. The protein is a component of the TFILD fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol.

                            polypeptide, hTAFTI100 (mol. weight 100kD). TAF peptides derived from hTAFTI30 alpha, hTAFTI30 beta, hTAFTI40, hTAFTI70, hTAFTI70, hTAFTI100, hTAFTI70, hTAFTI250, hTAFTI30 beta, hTAFTI110, and nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, II and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typical
                                                                                                                                                                                   Nucleic acids encoding human TATA-binding (TAF) peptide(s) - for production of record for modulating transcription of TAFs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RNA polymerase transcription; TATA-binding protein; TBP; initiation.

cc compound for interaction with essential proteins (EP) or for modulation cc of EP activity e.g fungal gene transcription. The proteins tested in the cc invention include RPC34, PDP3, TRAZ, NAB2, MPT1, MTR2, BOS1, PDL30, RSA2, CC SQT1, MTW1, TFB1, SPC98, BFR2, RNAL, GCD7, SK16, KIP1, LCP5, NCE103, CC ECO1, ORC2, CNS1, YPD1, TIM10 and SRB4 from S. cerevislae, C. albicans CC and human homologues. The method involves contacting a culture with one CC or more test compounds and determining the effects on the growth or CC unibility of the culture of cells which preferably comprises fungal cells or yeast cells. Preferably the identified compounds interact with, or CC modulate (preferably inhibit) activity of C. albicans EP. The inhibitor CC inhibiting fungal, particularly C. albicans EP. The inhibitor CC inhibiting fungal agents interact with essential fungal elements CC that can be used to treat fungal infection by preventing the growth and CC preferantially killing the fungi, but does not inhibit the biological CC activity of mammalian homologues. This amino acid sequence represents a cc method of the invention.

(TBP) associated factor (TAR) designated TARTIIIO. The protein is a component of the TFIID fraction required for reconstituting RNA polymerase II in vitro transcription activity. The encoded protein has an estimated mol. wt. of 110 kD by SDS-PAGE, a calculated mol. wt. based on sequence of the gene of 99.4 kD and an estimated pl of 10.1. The invention relates to purified proteins involved in transcription by RNA polymerase II, the RNA polymerase which transcribes messenger RNA. RNA polymerase II transcription proceeds in vitro upon addition of several nuclear fractions designated TFIIA, B, D, E, F, H, I and J to RNA polymerase II holoenzyme. Fraction TFIID has been shown to contains a TBP and other TAFs. Purification of TFIID and separation of its components reveals 7 proteins ranging in size from 30-250 kD. Serum raised against the TFIID fraction allowed cloning of the corresp.

                                                                                                                                                                                                                               AAW25028 represents TATA-binding protein associated factor (TAF) polypeptide, dTAFII10 (mol. weight 110kD). TAF peptides derived from dTAFII30 alpha, dTAFII30 beta, dTAFII40, dTAFII60, dTAFII80, dTAFII10, dTAFII50, and dTAFII250, their human equivalents and nucleic acids encoding them, are used to modulate transcription, including transcription initiation. TAFS are nuclear proteins involved in RNA polymerase I, I and III transcription. The peptides act by binding to a different TAF, an activator, or TBP (TATA-binding protein) or competitively inhibiting association of a TAF domain with another compound, typically a protein like TBP or another TAF, an activator,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tjian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TATA-binding
                                                                                                                                                                                                                                                                                                                                                                      Example 1; Column 35-40;
                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding human TATA-binding (TAF) peptide(s) - for production of recon
                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Š
                  sequences (ABL01840-ABL16175) and the encoded proceed process. (ABB57737-ABB72072).

The sequence data for this patent did not form specification, but was obtained in electronic is at ftp.wipo.int/pub/published_pct_sequences.
                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-rell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-ABL30511).
                                                                                                                                                                                        New isolated nucleic acid genes from Drosophila and interactions -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             õ
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventuseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
